## Oracle EBS Login Page Error : The page cannot be found

Normally, after cloning a new test environment on a new server, when we try to get the login page by url “[http://ServerName.domain:port/OA\\_HTML/AppsLocalLogin.jsp](http://ServerName.domain:port/OA_HTML/AppsLocalLogin.jsp)”, we get the error message “The page cannot be found”.

Also if we try <http://ServerName.domain:port> and we will get the same error message.

### Solution :

**Step 1 :** First , we need to check all Apache configuration files - httpd.conf, httpds.conf, apps.conf, oprocmgr.conf, httpd\_pls.conf .

**Step 2 :** We need to check required Linux RPM's that may be missing as it is a new server.

**Step 3 :** We need to check the /etc/hosts file :

Most of the time, we make wrong entry in /etc/hosts file as shown below.

```
127.0.0.1 localhost.localdomain localhost ServerName
192.168.214.134 ServerName
```

We need to edit the /etc/hosts file as follows:

```
127.0.0.1 localhost.localdomain localhost
192.168.214.134 ServerName.domain ServerName
```

**Step 4 :** Clear cache from \$COMMON\_TOP/\_pages/\_oa\_\_html/

**Step 5 :** Restart Apache

Now we will get the login page.....
